

Project Design Phase

Problem – Solution Fit Template

Date	03 October 2026
Team ID	6ab7f10630f9767f87728ca3
Project Name	Import Data Using Transform Maps (Spreadsheet)
Team Leader	E Dilli Kumar
Team Members	R Vinish, K Jerina, B Mohanavalli, P Sri Ragavan
Maximum Marks	2 Marks

Problem – Solution Fit Template:

The Problem-Solution Fit means that a real problem has been found with the customer and that the solution realized for it actually solves that problem. It helps identify behavioral patterns and recognize what would work and why. For this project, the problem is the slow, error-prone manual entry of spreadsheet data into a system, and the solution is importing the data automatically using Import Sets and Transform Maps.

Purpose:

- Solve complex data-entry problems in a way that fits the state of the customers.
- Succeed faster and increase adoption by tapping into existing behavior, since users already keep their data in spreadsheets.
- Sharpen communication and marketing strategy with the right triggers and messaging.
- Increase touch-points by solving frequent annoyances and costly problems such as duplicate and incorrect records.
- Understand the existing situation in order to improve it for the target group.

Template (Problem-Solution Fit Canvas):

1. Customer Segment(s)	• Administrators and data managers who maintain records in the platform. • Support, HR, asset and IT operations teams that receive bulk data in spreadsheets. • Organizations migrating data from older systems or Excel files.
2. Jobs-To-Be-Done / Problems	• Load large spreadsheets (.xlsx / .csv) into the correct table quickly. • Map spreadsheet columns to the right fields of the target table. • Avoid duplicate, missing or wrongly formatted records. • Find out which rows failed and why.
3. Triggers	• A bulk of new data arrives in a spreadsheet (new employees, assets, users, incidents). • A system migration or a periodic data update is due. • Manual entry of hundreds of rows becomes too slow and tiring.
4. Emotions: Before / After	Before: frustrated, stressed, afraid of mistakes, wasting time on repetitive typing. After: confident, relieved, in control, and saves time because data is imported accurately in a few clicks.
5. Available Solutions	• Manual entry of each record, which is slow and error-prone. • Copy and paste into list views, which has no mapping or validation. • Custom scripts, which need coding skills and are hard to maintain.

6. Customer Constraints	• Limited technical or coding knowledge. • Spreadsheet formats and column names differ from the system fields. • Limited time, and a need to protect existing data from being overwritten.
7. Behavior / Problem Root Cause	• Data is created and shared in spreadsheets, not in the system. • No standard mapping between spreadsheet columns and system fields. • No validation or duplicate check (coalesce) during manual entry.
8. Channels of Behavior	Online: uploads spreadsheet files through the Load Data page, views the import status, error logs and transform history, and searches help articles and tutorials. Offline: prepares and cleans data in Excel, discusses mapping requirements with the team, and shares spreadsheets by email or removable storage.
9. Your Solution	• Upload the spreadsheet to create an Import Set (staging table). • Use a Transform Map to map source columns to target fields, with coalesce on key fields to prevent duplicates. • Use transform scripts to convert and validate data, then insert or update records in the target table. • Show an import log with inserted, updated, skipped and failed rows so errors can be fixed and the import re-run. • Result: faster, accurate, repeatable data import with no manual typing.
