

Project Development Phase

Model Performance Test

Date	04 October 2026
Team ID	6ab7f10630f9767f87728ca3
Project Name	Import Data Using Transform Maps (Spreadsheet)
Team Leader	E Dilli Kumar
Team Members	R Vinish, K Jerina, B Mohanavalli, P Sri Ragavan
Maximum Marks	

Model Performance Testing: Project team shall fill the following information in the model performance testing template.

S.No.	Parameter	Values	Screenshot
1.	Model Summary	Import data model (Spreadsheet to Table): - Source: Spreadsheet file (.xlsx / .csv) containing records such as users, incidents or assets, uploaded as an attachment to a Data Source. - Staging: Data is loaded into an Import Set (staging) table with one column per spreadsheet column. - Transform Map: Maps the Import Set table to the target table using Field Maps (source field to target field), direct and scripted mappings. - Coalesce: A key field (e.g. Employee ID / Email) is set to coalesce so that existing records are updated and duplicates are not created. - Transform scripts: onBefore / onAfter scripts clean values (trim spaces, normalise case, date format) and skip invalid rows. - Output: Records inserted or updated in the target table, with an Import Set Run log listing inserted, updated, ignored and error counts.	[Insert screenshot] - Import Set Run / Transform History showing inserted, updated, ignored and error counts. - Transform Map field mapping page.
2.	Accuracy	Training Accuracy (test import on a 50-row sample sheet used to build and tune the transform map): 96% (48 of 50 rows transformed correctly; 2 rows ignored because of empty mandatory fields). Validation Accuracy (unseen 200-row sheet imported after the map was finalised): 94.5% (189 of 200 rows inserted/updated correctly; 11 rows skipped for invalid date, missing key or choice-value mismatch).	[Insert screenshot] Training run result (50-row sample) Validation run result (200-row sheet)

S.No.	Parameter	Values	Screenshot
3.	Fine Tuning Result (if done)	Fine tuning applied: - Added coalesce on the unique key field to stop duplicate records. - Added onBefore script to trim spaces, convert text to the correct case and reformat dates. - Mapped choice and reference fields using lookup values instead of raw text. - Marked mandatory fields in the sheet header validation. Validation Accuracy after fine tuning: 99% (198 of 200 rows imported correctly; 2 rows rejected for genuinely missing mandatory data).	[Insert screenshot] Transform History after fine tuning (198 / 200 successful)

Accuracy = (rows correctly inserted or updated / total rows in the spreadsheet) x 100. The numbers above are sample values and screenshot slots are placeholders: replace them with the counts and screenshots from your own Transform History before submitting.
